

MAX3221/MAX3223/ MAX3243

+3V to +5.5V RS-232 Transceivers with AutoShutdown

General Description

The MAX3221/MAX3223/MAX3243 achieve 1 μ A supply current with Maxim's revolutionary AutoShutdown™ feature. When the MAX3221/MAX3223/MAX3243 do not sense a valid signal level on their receiver inputs, the on-board power supply and drivers shut down. This occurs if the RS-232 cable is disconnected or if the transmitters of the connected peripheral are turned off. The system turns on again when a valid level is applied to any RS-232 receiver input.

The MAX3221/MAX3223/MAX3243 require only 0.1 μ F capacitors in 3.3V operation, and can operate from input voltages ranging from +3.0V to +5.5V.

A proprietary, high-efficiency, dual charge-pump power supply and a low-dropout transmitter combine to deliver true RS-232 performance from a single +3.0V to +5.5V supply.

The MAX3221 is a 1-driver/1-receiver 16-pin SSOP version of the 20-pin 2-driver/2-receiver MAX3223.

The MAX3243 is a 3-driver/5-receiver with a complementary always-active receiver for external monitoring in a variety of 28 pin packages. See *Order Information* table for package offerings.

Applications

- Battery-Powered Equipment
- Hand-Held Equipment
- Peripherals
- Portable Diagnostics Equipment

Selector Guide

PART	Tx	Rx	V _{CC} RANGE (V)	AutoShutdown
MAX3221	1	1	3.0 to 5.5	Yes
MAX3223	2	2	3.0 to 5.5	Yes
MAX3243	3	5	3.0 to 5.5	Yes

Pin Configurations appear at end of data sheet.

Typical Operating Circuits appear at end of data sheet.

AutoShutdown and UCSP are trademarks of Maxim Integrated Products, Inc.

Benefits and Features

- Integrated Charge Pump Circuitry Simplifies Power Requirements
 - Eliminates the Need for a ± 12 Supply
 - Operation From a Single +3.3V or +5V Supply
- 1 μ A Supply Current in Shutdown Mode Saves Power
 - AutoShutdown Feature is Enabled After No Activity on Receiver Inputs for 30 μ s
 - Software Control Option for Shutdown

Note 1: V+ and V- can have maximum magnitudes of 7V, but their absolute difference cannot exceed 13V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

(V_{CC} = +3.0V to +5.5V, C1–C4 = 0.1μF (Note 2), T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.)

Pin Description

PIN			NAME	FUNCTION
MAX3221	MAX3223	MAX3243		
1	1	—	$\overline{\text{EN}}$	Receiver Enable Control. Drive low for normal operation. Drive high to force the receiver outputs into a high-Z state.
5	5	1	C2+	Positive terminal of inverting charge-pump capacitor
6	6	2	C2-	Negative terminal of inverting charge-pump capacitor
7	7	3	V-	-5.5V generated by the charge pump
8	9, 16	4–8	R_IN	RS-232 Receiver Inputs
13	8, 17	9, 10, 11	T_OUT	RS-232 Transmitter Outputs
11	12, 13	12, 13, 14	T_IN	TTL/CMOS Transmitter Inputs
9	10, 15	15–19	R_OUT	TTL/CMOS Receiver Outputs
—	—	20	R2OUTB	Noninverting Receiver Output—active in shutdown
10	11	21	$\overline{\text{INVALID}}$	Output of the valid signal detector. Indicates if a valid RS-232 level is present on receiver inputs logic “1”.
16	20	22	$\overline{\text{FORCEOFF}}$	Drive low to shut down transmitters and on-board power supply. This overrides all automatic circuitry and FORCEON (Table 1).
12	14	23	FORCEON	Drive high to override automatic circuitry keeping transmitters on ($\overline{\text{FORCEOFF}}$ must be high) (Table 1).
4	4	24	C1-	Negative terminal of the voltage doubler charge-pump capacitor
14	18	25	GND	Ground
15	19	26	V _{CC}	+3.0V to +5.5V Supply Voltage
3	3	27	V+	+5.5V generated by the charge pump
2	2	28	C1+	Positive terminal of the voltage doubler charge-pump capacitor

Detailed Description

Dual Charge-Pump Voltage Converter

The MAX3221/MAX3223/MAX3243's internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), regardless of the input voltage (V_{CC}) over the +3.0V to +5.5V range. The charge pumps operate in a discontinuous mode: if the output voltages are less than 5.5V, the charge pumps are enabled; if the output voltages exceed 5.5V, the charge pumps are disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

RS-232 Transmitters

The transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels. They guarantee a 120kbps data rate with worst-case loads of 3k Ω in parallel with 1000pF, providing compatibility with PC-to-PC communication software (such as Laplink™). Typically, the MAX3221/MAX3223/MAX3243 can operate at data rates of 235kbps. Transmitters can be paralleled to drive multiple receivers or mice (MAX3243). Figure 1 shows a complete system connection.

When $\overline{\text{FORCEOFF}}$ is driven to ground, or the auto-shutdown circuitry senses invalid voltage levels at all receiver inputs, the transmitters are disabled and the outputs are forced into a high-impedance state.

LapLink is a trademark of Traveling Software.

+3V to +5.5V RS-232 Transceivers with AutoShutdown

The MAX3221/MAX3223/MAX3243's receivers convert RS-232 signals to CMOS-logic output levels. All receivers have one inverting three-state output. In shutdown ($\overline{\text{FORCEOFF}} = \text{low}$) or in AutoShutdown, the MAX3221/MAX3223's receivers are active (Table 1). Driving $\overline{\text{EN}}$ high places the receiver(s) in a high-impedance state. The MAX3243's receivers are high impedance when the part is shut down.

The MAX3243 has an always-active complementary output (R2OUTB). R2OUTB is an extra output that monitors receiver activity while the other receivers are high impedance. This allows Ring Indicator to be monitored without forward biasing other devices connected to the receiver outputs. This is ideal for systems where V_{CC} is set to 0V in shutdown to accommodate peripherals, such as UARTs (Figure 2).

MAX3221/MAX3223/ MAX3243

+3V to +5.5V RS-232 Transceivers with AutoShutdown

Table 1a. MAX3221/MAX3223 FORCEOFF and Enable Control Truth Table

FORCEOFF	EN	T_OUT	R_OUT
0	0	High-Z	Active
0	1	High-Z	High-Z
1	0	Active*	Active
1	1	Active*	High-Z

Table 1b. MAX3243 FORCEOFF Control Truth Table

FORCEOFF	T_OUT	R_OUT	R2OUTB
0	High-Z	High-Z	Active
1	Active*	Active*	Active

***Note:** If the part is in AutoShutdown mode ($\overline{\text{FORCEOFF}} = V_{CC}$, $\text{FORCEON} = \text{GND}$), it is shut down if no valid RS-232 levels are present on all receiver inputs.

AutoShutdown

A 1 μA supply current is achieved with Maxim's new AutoShutdown feature, which operates when $\overline{\text{FORCEON}}$ is low and $\overline{\text{FORCEOFF}}$ is high. When the MAX3221/MAX3223/MAX3243 sense no valid signal levels on all receiver inputs for 30 μs , the on-board power supply and drivers are shut off, reducing supply current to 1 μA . This occurs if the RS-232 cable is disconnected or the connected peripheral transmitters are turned off. The system turns on again when a valid level is applied to any RS-232 receiver input. As a result, the system saves power without changes to the existing BIOS or operating system. When using AutoShutdown, the $\overline{\text{INVALID}}$ output is high when the device is on and low when the device is shut down. Because $\overline{\text{INVALID}}$ indicates the receiver inputs' condition, it can be used in any mode (Figure 3).

Table 2 and Figure 3c summarize the MAX3221/MAX3223/MAX3243 operating modes. $\overline{\text{FORCEON}}$ and $\overline{\text{FORCEOFF}}$ override the automatic circuitry and force the transceiver into its normal operating state or into its low-power standby state. When neither control is asserted, the IC selects between these states automatically based on receiver input levels. Figures 3a, 3b, and 5a depict valid and invalid RS-232 receiver levels.

A mouse or other system with AutoShutdown may need time to wake up. Figure 4 shows a circuit that forces the transmitters on for 100ms, allowing enough time for the other system to realize that the MAX3221/MAX3223/

Figure 3a. MAX32__ Entering 1 μA Supply Mode Through AutoShutdown

Figure 3b. MAX32__ with Transmitters Enabled Using AutoShutdown

Figure 3c. AutoShutdown Logic

Figure 4. AutoShutdown with Initial Turn-On to Wake Up a Mouse or Another System

RS-232 SIGNAL PRESENT AT RECEIVER INPUT	$\overline{\text{FORCEOFF}}$ INPUT	FORCEON INPUT	$\overline{\text{INVALID}}$ INPUT	TRANSCEIVER STATUS
Yes	H	X	H	Normal Operation
No	H	H	L	Normal Operation (Forced On)
No	H	L	L	Shutdown (AutoShutdown)
Yes	L	X	H	Shutdown (Forced Off)
No	L	X	L	Shutdown (Forced Off)

When shut down, the device's charge pumps are turned off, V_+ decays to V_{CC} , V_- decays to ground, and the transmitter outputs are disabled (high impedance). The time required to exit shutdown is typically 100 μ s (Figure 5b).

If direct software control is desired, $\overline{\text{INVALID}}$ can be used to indicate DTR or Ring Indicator signal. Tie FORCEOFF and $\overline{\text{FORCEON}}$ together to bypass AutoShutdown so the line acts like a $\overline{\text{SHDN}}$ input.

Capacitor Selection

When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR) usually rises at low temperatures and influences the amount of ripple on V+ and V-.

Figure 6. Transmitter Outputs When Exiting Shutdown or Powering Up

Power-Supply Decoupling

In most circumstances a 0.1µF bypass capacitor is adequate. In applications that are sensitive to power-supply noise, decouple V_{CC} to ground with a capacitor of the same value as the charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

Transmitter Outputs when Exiting Shutdown

Figure 6 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels. Each transmitter is loaded with 3kΩ in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V_- exceeds approximately 3V. Figure 7a shows the MAX3243's transmitter output voltage vs. current per transmitter. Figure 7b is a mouse driver test circuit.

Mouse Driveability (MAX3243)

The MAX3243 has been specifically designed to power serial mice while operating from low-voltage power supplies. It has been tested with samples of ten major mouse models from six manufacturers including the leading three: Logitech (5 models), Mouse Systems, and Microsoft. The MAX3243 successfully drove all

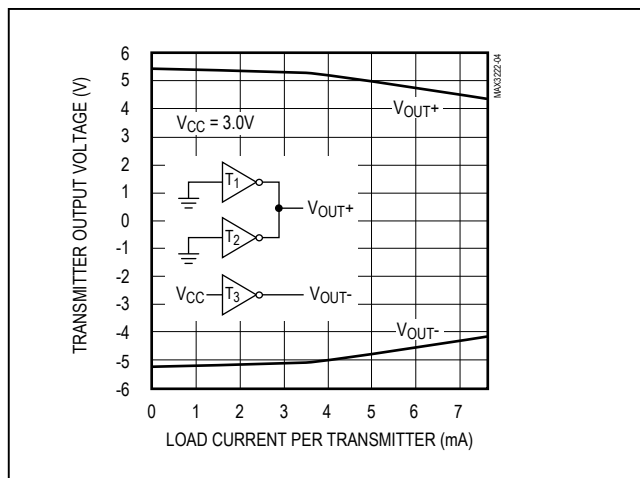

Figure 7a. MAX3243 Transmitter Output Voltage vs. Load Current per Transmitter

serial mice and met their respective current and voltage requirements. Figure 7a shows the transmitter outputs under increasing load current. The MAX3243's switching regulator ensures the transmitters will supply at least $\pm 5V$ during worst-case conditions. The AutoShutdown feature does not work with a mouse, so $\overline{FORCEOFF}$ and $\overline{FORCEON}$ should be connected to V_{CC} .

High Data Rates

The MAX3221/MAX3223/MAX3243 maintain the RS-232 $\pm 5.0V$ minimum transmitter output voltage even at high data rates. Figure 8 shows a transmitter loopback test circuit. Figure 9 shows a loopback test result at 120kbps, and Figure 10 shows the same test at 235kbps. For Figure 9, all three transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF. For Figure 10, a single transmitter was driven at 235kbps, but all three transmitters were loaded with an RS-232 receiver in parallel with 1000pF.

Interconnection with 3V and 5V Logic

The MAX3221/MAX3223/MAX3243 can directly interface with various 5V logic families, including ACT and HCT CMOS. See Table 4 for more information on possible combinations of interconnections.
